SUMMARY

Software engineer building multi-tenant distributed systems in Go for Omniful's logistics SaaS (OMS, WMS, TMS). Cut order-search p95 latency from 900ms to 30ms at 800K+ daily requests, and authored a MongoDB data-access library used by ~30 engineers across 12+ microservices. Currently lead a 5-engineer pod and internal developer-platform work.

EXPERIENCE

Omniful Technologies — Gurugram, India

Multi-tenant SaaS platform for order, warehouse, and transport management

Software Development Engineer 2 — August 2024 – Present

- Led migration of OMS order search to MongoDB Atlas Search: designed index mappings, custom analyzers, fuzzy matching, and cursor-based pagination across multi-tenant data, **cutting p95 latency from 900ms to 30ms at 800K+ daily requests**.
- Authored **mongodm**, an internal Go MongoDB library with type-safe generic collections, fluent query builders, and enforced tenant scoping; adopted as the standard data-access layer by **~30 engineers across 12+ microservices**, eliminating cross-tenant query bugs.
- Architected a rule engine running **50K+ executions/day**, a declarative DSL that lets tenants automate routing, segregation, and SLA-based exception handling across OMS and WMS, replacing hardcoded service logic.
- Decoupled order creation from fulfillment to launch shipment-only orders, introducing new order states with backward-compatible event contracts; **20+ logistics-only tenants** now run **5K+ orders** on this path.
- Built the networking layer (Traefik routing, CoreDNS service discovery) for the company's local-development platform, **cutting engineer environment setup from days to under an hour**.
- Lead a **5-engineer pod** covering design reviews, code reviews, onboarding, and production debugging; mentored **7+ engineers** to independent feature ownership.

Software Development Engineer 1 — September 2023 – August 2024

- Rebuilt catalog duplicate detection using MongoDB `explain()` analysis, replacing repeated re-aggregation with a streaming cursor pipeline; **cut execution from 17s to 6.5s on 600K+ documents** and ended recurring CPU-saturation incidents.
- Designed an event-driven bulk SKU pipeline on Kafka and AWS SQS with Redis distributed locks, idempotent consumers, and event-key deduplication, handling **50K+ SKUs per upload** under at-least-once delivery with zero duplicate writes.
- Cut "city not found" shipment failures by **80%** and related support tickets by **90%** with a tenant-aware city-resolution service: a fallback chain across internal mappings, tenant overrides, and Google Geocoding, backed by Redis caching.
- Instrumented Prometheus and Grafana across **200+ SQS queues** and DLQs with alerts on queue depth, consumer lag, and DLQ rate, **halving incident MTTR** across the on-call rotation.

Software Development Engineer Intern — February 2023 – September 2023

- Helped build multi-tenant RBAC at the API gateway using JWT claims and a centralized permission registry; the design now enforces authorization for **50+ enterprise workspaces**.
- Developed the WMS Hub Service (aisle/shelf/bin location hierarchy for putaway and picking) and an order-consolidation algorithm that **improved picking efficiency by 50%**.

Thomson Digital — Noida, India

Editorial and publishing services for global education and media clients

Project Manager — February 2020 – February 2022

- Owned end-to-end delivery of editorial and publishing projects for global clients across parallel workstreams.

PROJECT

AI Webhook Ingestor – Go, PostgreSQL — webhookingestor.online | github.com/iamsushank/webhook-ingestor

- Built a webhook ingestion platform for logistics and finance vendors: sub-second acknowledgements via a split ingest/process path, a Postgres work queue (`FOR UPDATE SKIP LOCKED`) with retries and dead-lettering, and schema-constrained LLM normalization (OpenAI, Ollama) of arbitrary vendor payloads, tolerating out-of-order delivery.

TECHNICAL SKILLS

Languages: Go (primary), SQL, Python, JavaScript

Data & Messaging: MongoDB, Atlas Search, PostgreSQL, Redis, Apache Kafka, AWS SQS

Cloud & Infrastructure: AWS (ECS, SQS, S3, Lambda, CloudWatch), Docker, Kubernetes, Terraform, CI/CD

Observability: Prometheus, Grafana, New Relic, OpenTelemetry, distributed tracing

Architecture: Microservices, event-driven systems, multi-tenancy, idempotency, REST & gRPC API design

Testing & AI: Go testing, testify, Testcontainers, integration/load testing; LLM integration (OpenAI, Ollama), MCP

EDUCATION

Masai School, Bengaluru – Full-Stack Web Development — 2022 – 2023

NM Institute of Engineering and Technology, Bhubaneswar – B.Tech, Computer Science — 2016 – 2020
